Revealing brain circuits underlying sensory processing, plasticity, and neuropsychiatric disease

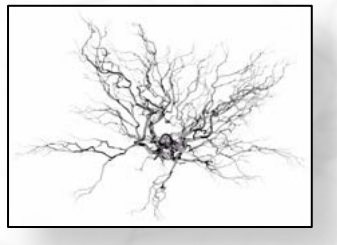
Benjamin Arenkiel, PhD

Associate Professor of Molecular & Human Genetics, Neuroscience,
& DDMT Graduate Program

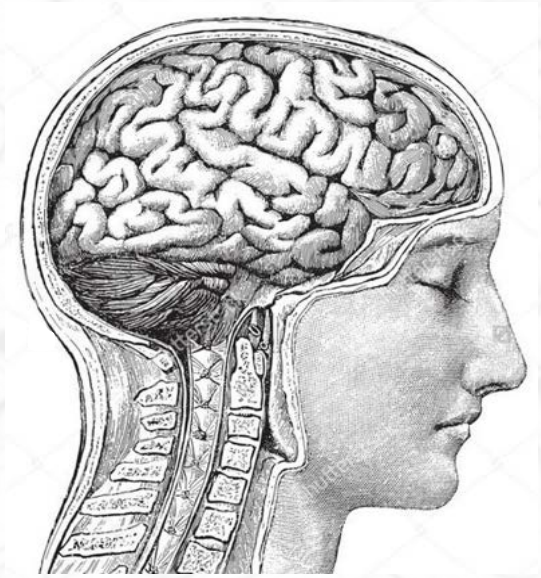
Baylor College of Medicine
Jan and Dan Duncan Neurological Research Institute
& Texas Children's Hospital

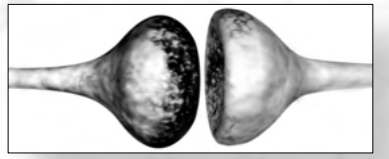
The main objective: to reveal mechanisms of how brain circuits are formed and function

genes



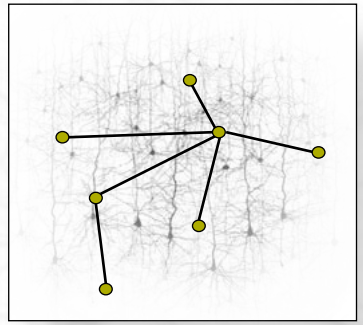
differentiation / specification





synaptogenesis

Biological function
-physiology
-behavior



connectivity

Dysfunctional brain circuits underlie neurological disorders

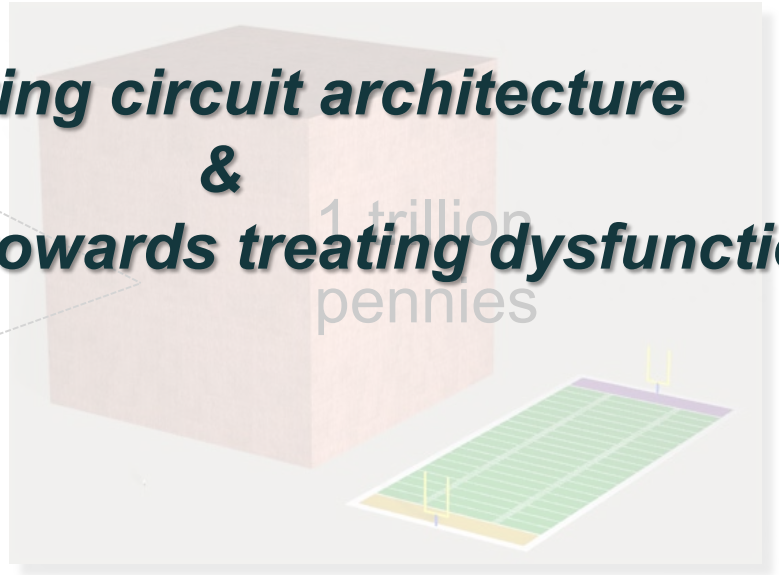
- Neurodevelopmental / cognitive disorders
- Neurodegenerative diseases
- Neuropsychiatric disorders
- Addictive / behavioral disorders

Brain architecture, circuitry, and function is complex

- 1 billion neurons
- 1 trillion connections

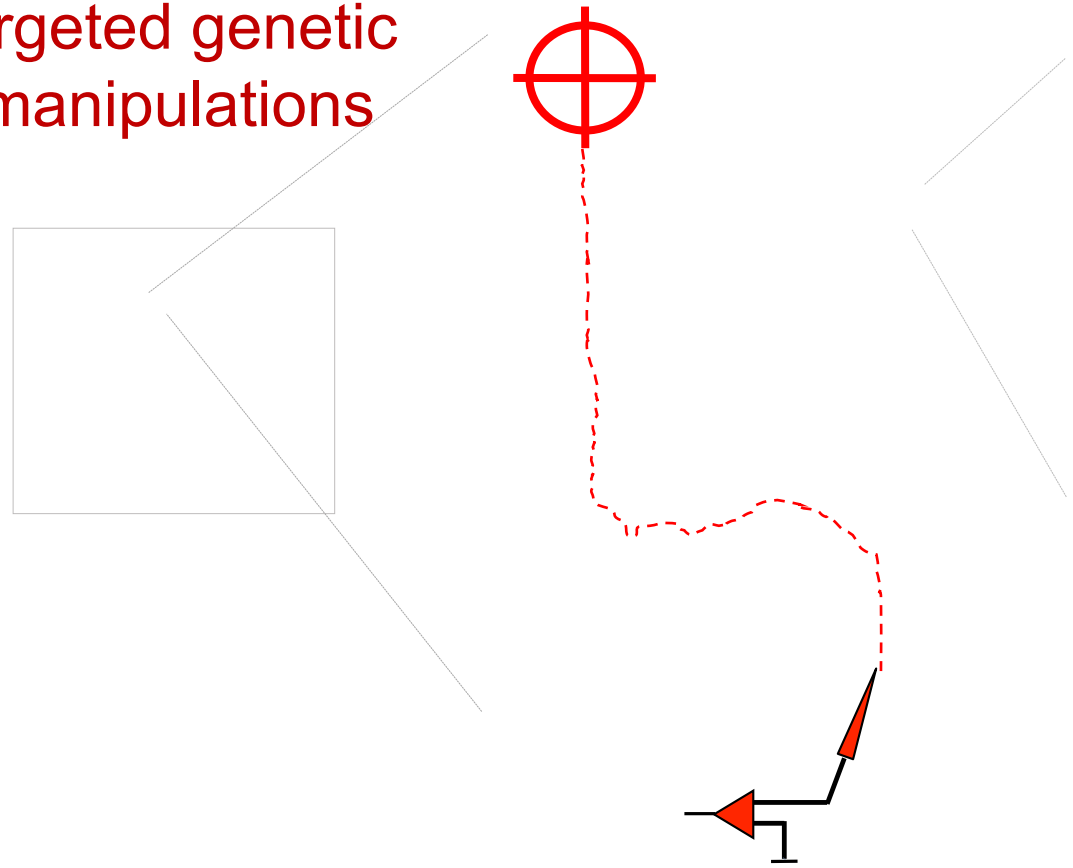
The Path Forward

elucidating circuit architecture
&
exploiting complexity towards treating dysfunction / disease



Genetic methods to mark, monitor, & manipulate neurons in mice allows brain circuit investigation

targeted genetic manipulations



- in vivo imaging
- electrophysiology
- optogenetics
- single cell sequencing
- anatomical tracing
- circuit mapping

The mouse olfactory system is a useful experimental model to study circuit formation & function

Behavior

Tractability

Anatomy

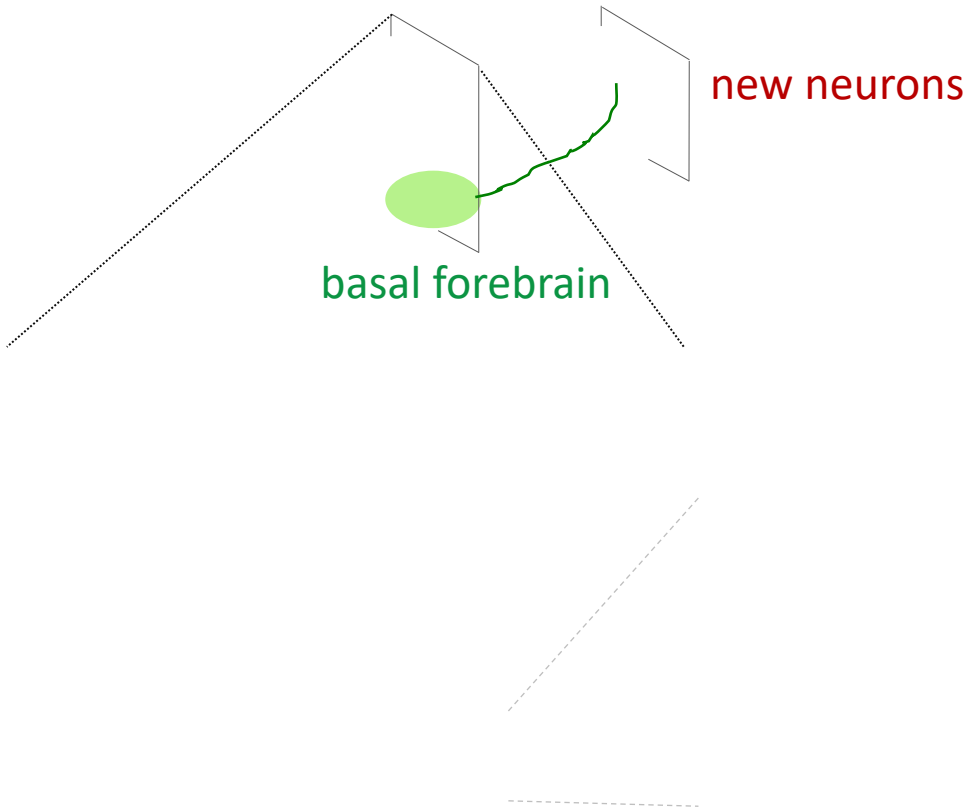
The cholinergic basal forebrain provides inputs onto adult-born neurons

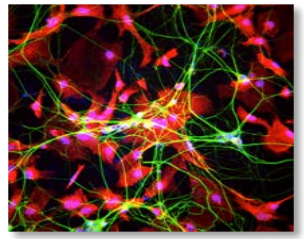


Rabies-EGFP	Rabies-EGFP	anti-ChAT	merge

ChAT = Choline acetyltransferase = acetylcholine synthesis

Cholinergic signaling is a candidate to influence circuit integration of adult-born neurons

- Cholinergic signaling influences olfaction

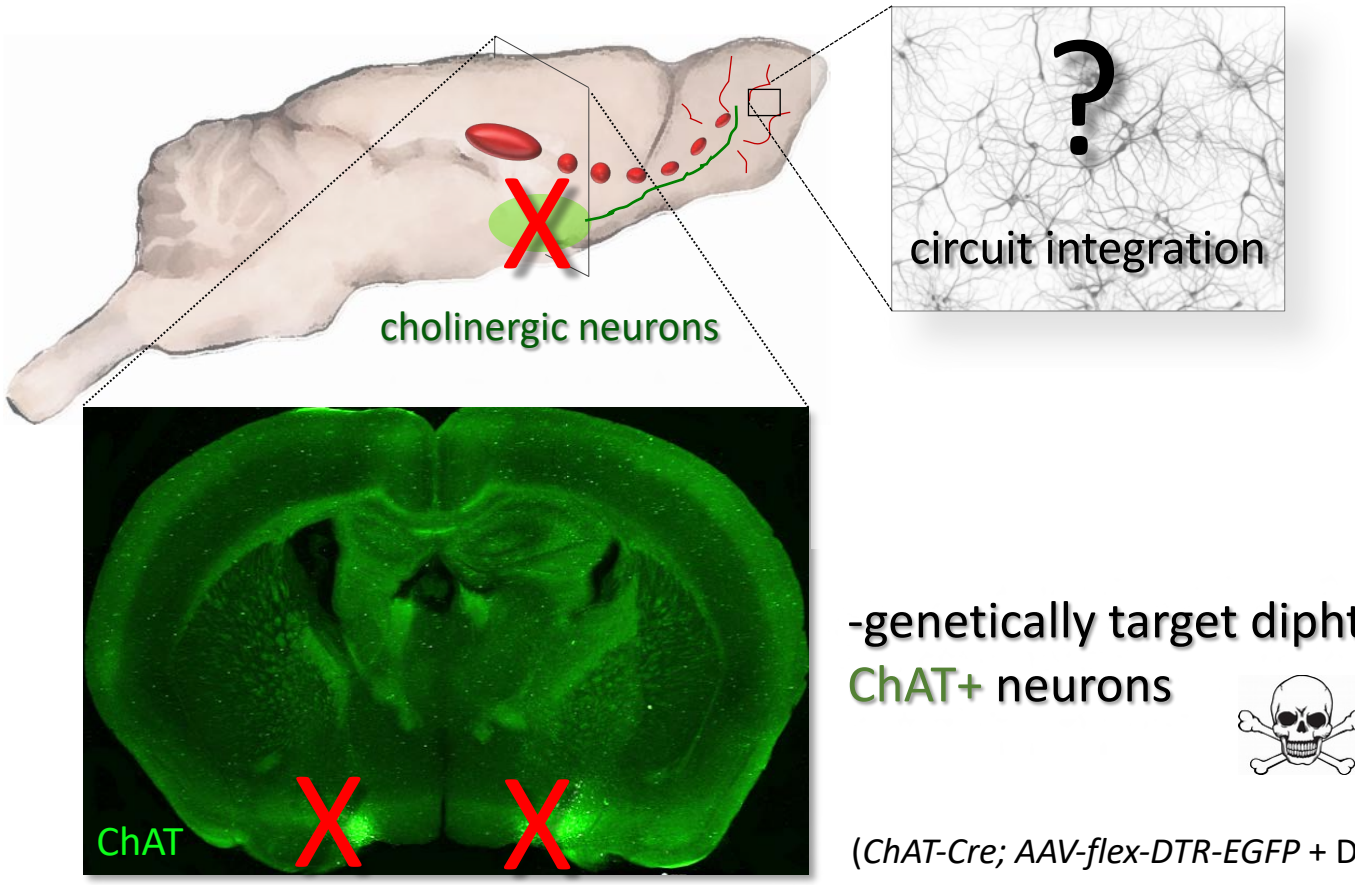


- Acetylcholine is synaptogenic

- Cholinergic signaling is linked to reward/arousal/plasticity

- Alzheimer's models treated with acetylcholinesterase blockers show increased adult-born neuron integration

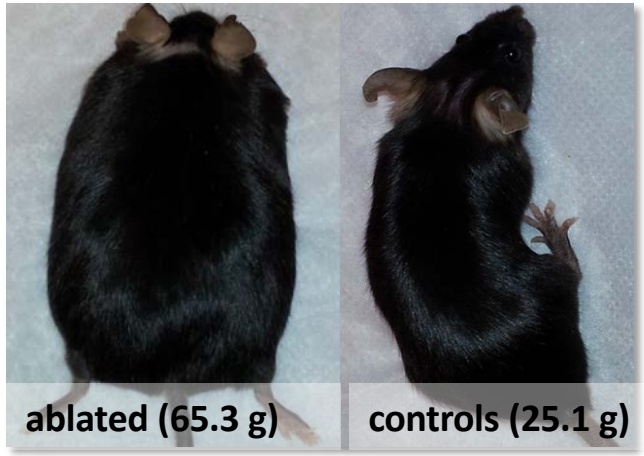
What happens to the adult-born neurons if we genetically manipulate cholinergic basal forebrain inputs?



-genetically target diphtheria toxin receptor to ChAT+ neurons (+DT)

(*ChAT-Cre; AAV-flex-DTR-EGFP* + DT injections)

Genetically targeted ablation of basal forebrain cholinergic neurons results in severe and rapid-onset obesity



Herman et al., *2016*

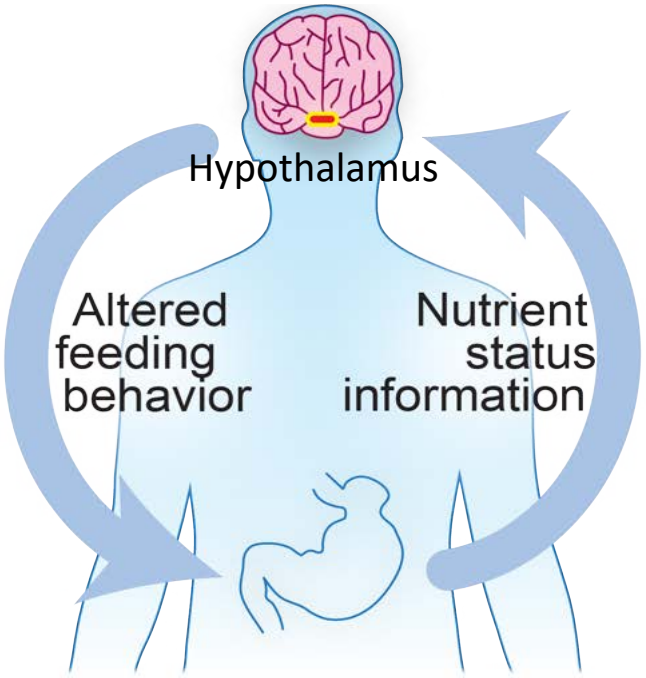
Loss of cholinergic basal forebrain signaling increases drive to eat, unchecked food consumption, and hyperphagia

Neural Stem Cells / Synapses / Plasticity →

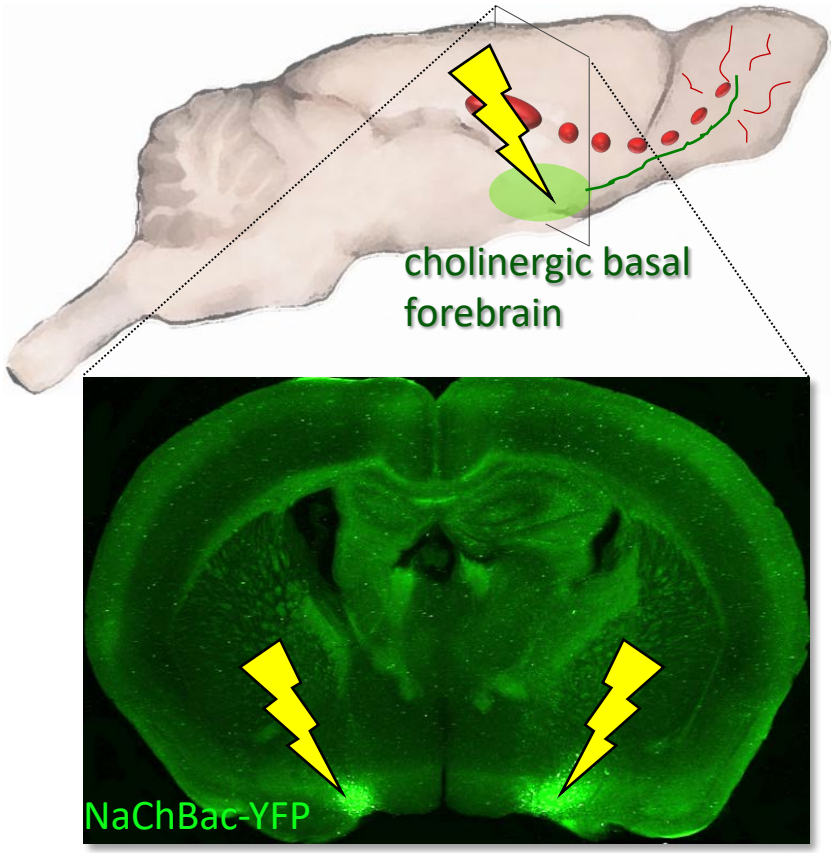
-Basal Forebrain-
feeding / addiction / aversion circuits

The central nervous system controls food intake

Homeostatic mechanisms



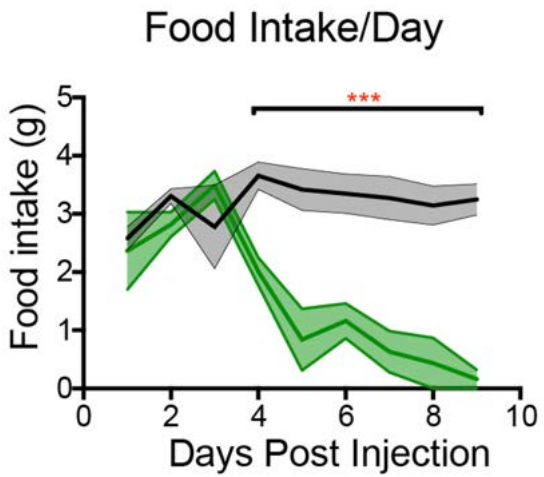
What happens if we genetically increase the activity of cholinergic basal forebrain inputs?

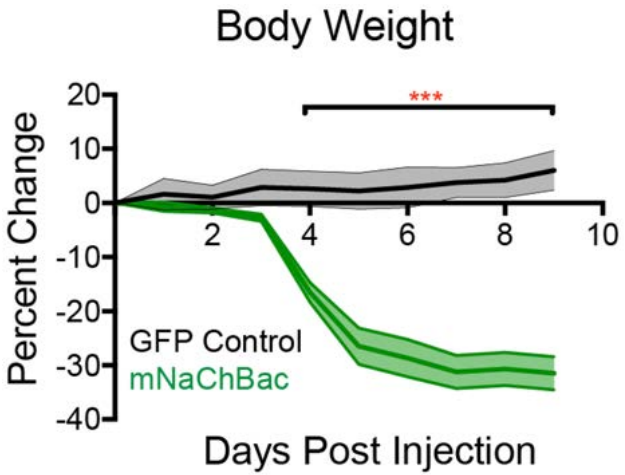


-genetically target NaChBac to basal forebrain neurons
(NaChBac = “leaky” sodium channel)

(*Vlut2-Cre; AAV-flex-NaChBac-YFP)*

Chronic activation of basal forebrain neurons causes decreased feeding & dramatic weight loss





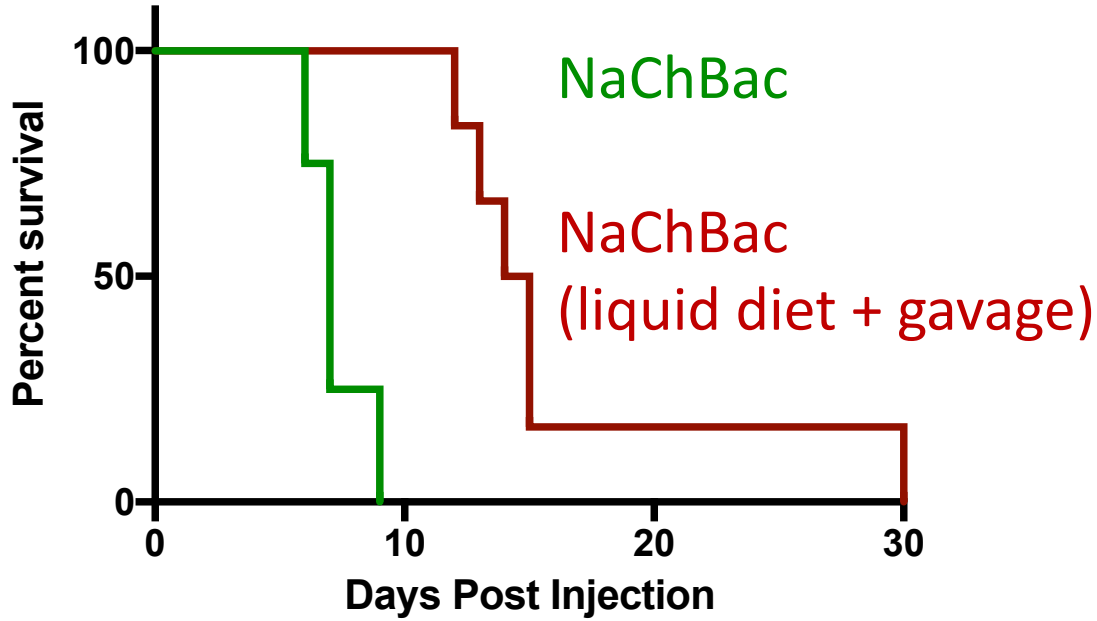
Patel et al., *2019*

Chronic activation of basal forebrain neurons induces voluntary hypophagia without initial metabolic dysfunction

No Changes in serum hormones (prior to malnutrition)

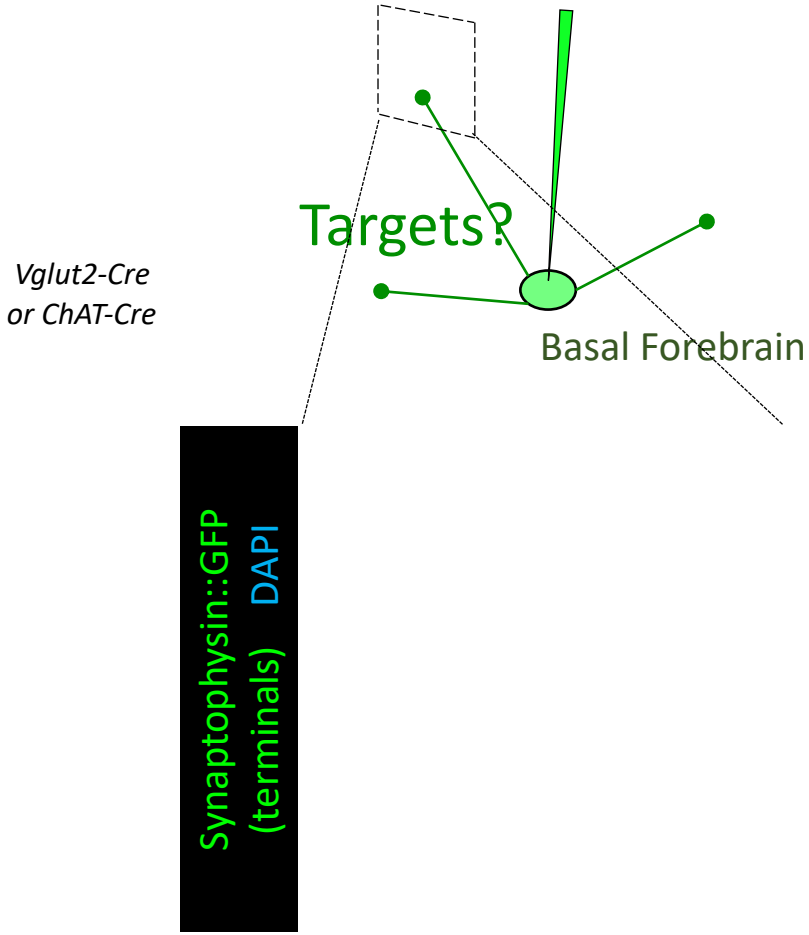
- **Pituitary**
  - *ACTH, FSH, GH, Prolactin, & TSH*
- **Thyroid**
  - *Free T4 & T3*
- **Glucose Metabolism**
  - *Glucose & Insulin*
- **Appetite Hormones**
  - *Leptin & Ghrelin*

Starvation can be rescued

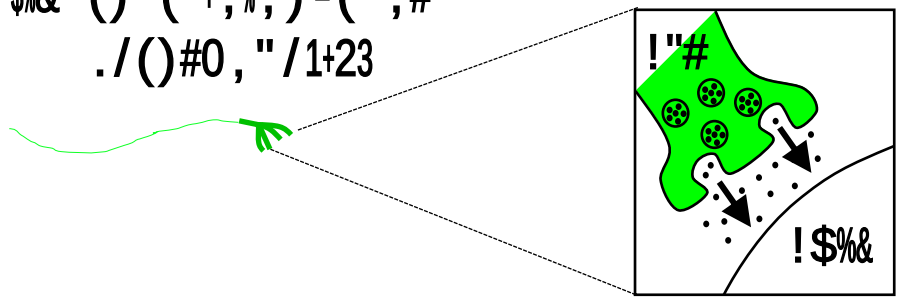


Labeling basal forebrain neuron terminals reveals downstream brain targets

AAV-Flex-Synaptophysin::GFP

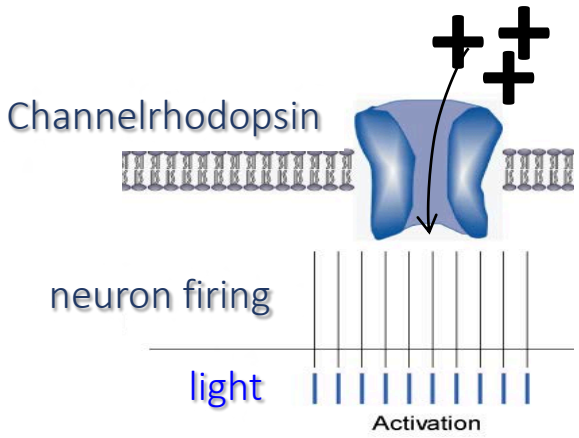


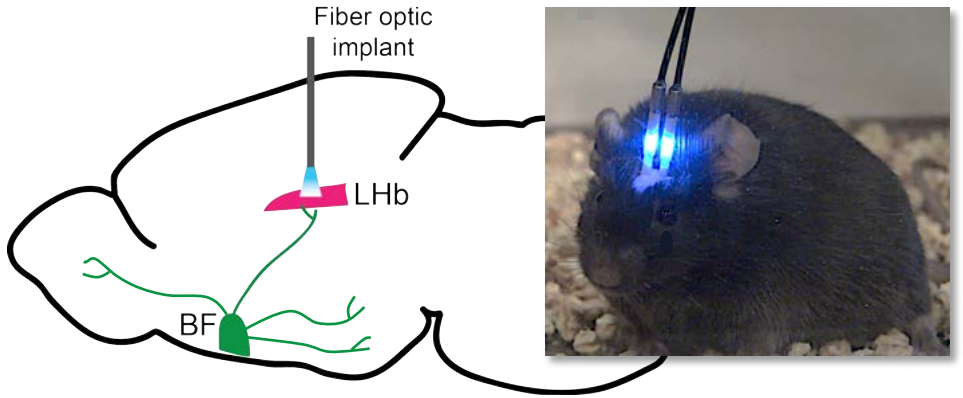
!"#"$%&'()*("+,%,)-(',#
./()#0,"/1+23



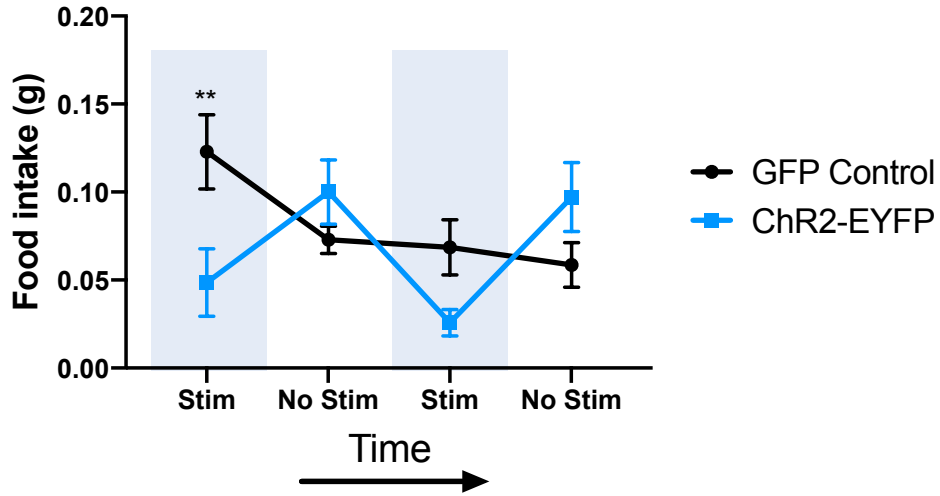
(target identification)

Activation of basal forebrain LHb inputs decreases feeding

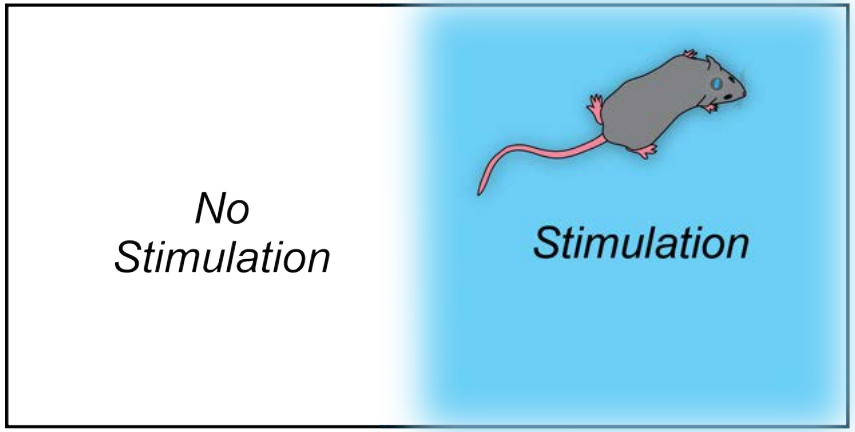


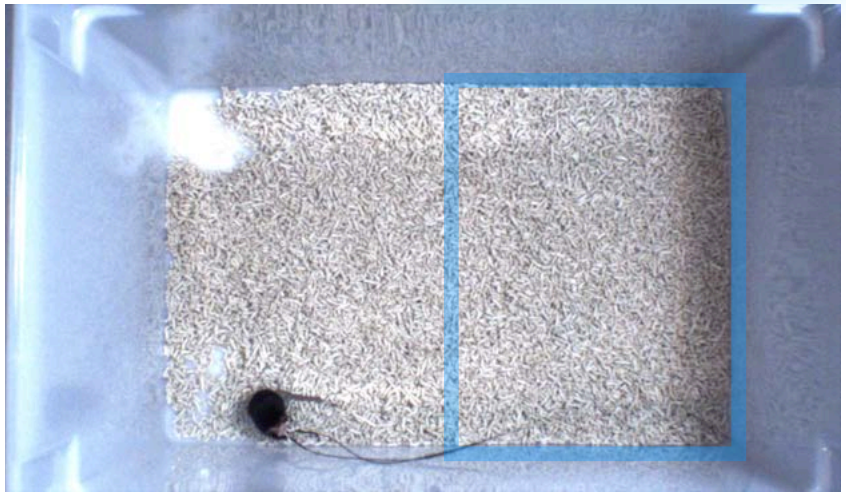


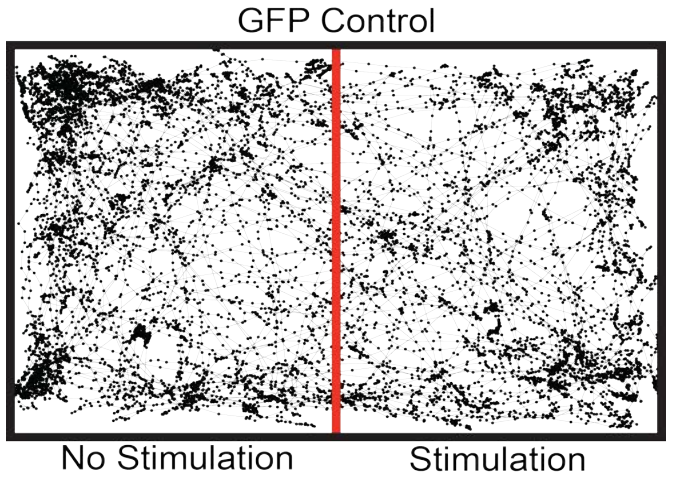
(*Vglut2-Cre; AAV-flex-ChR2-EYFP*)

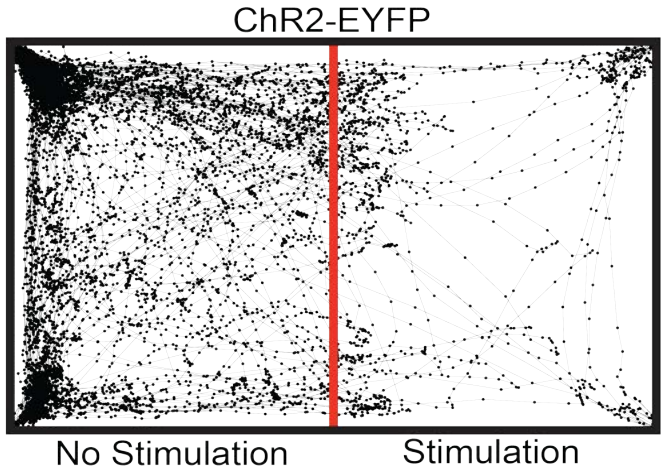


Optogenetic activation of basal forebrain-to-LHb inputs elicits aversion/avoidance

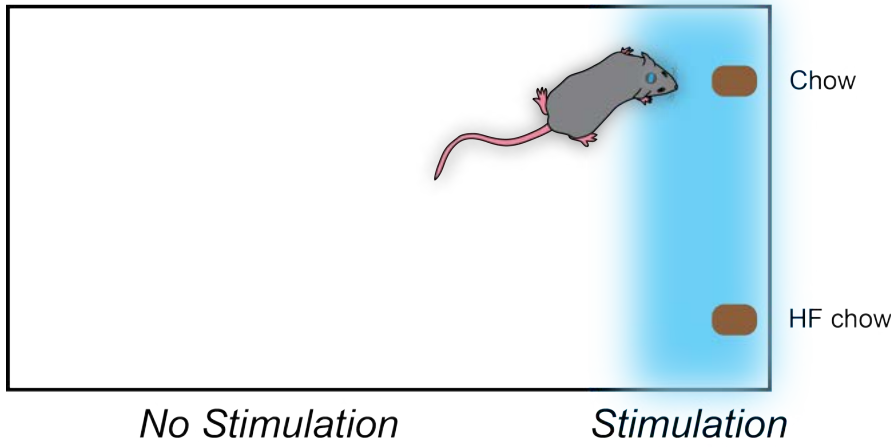


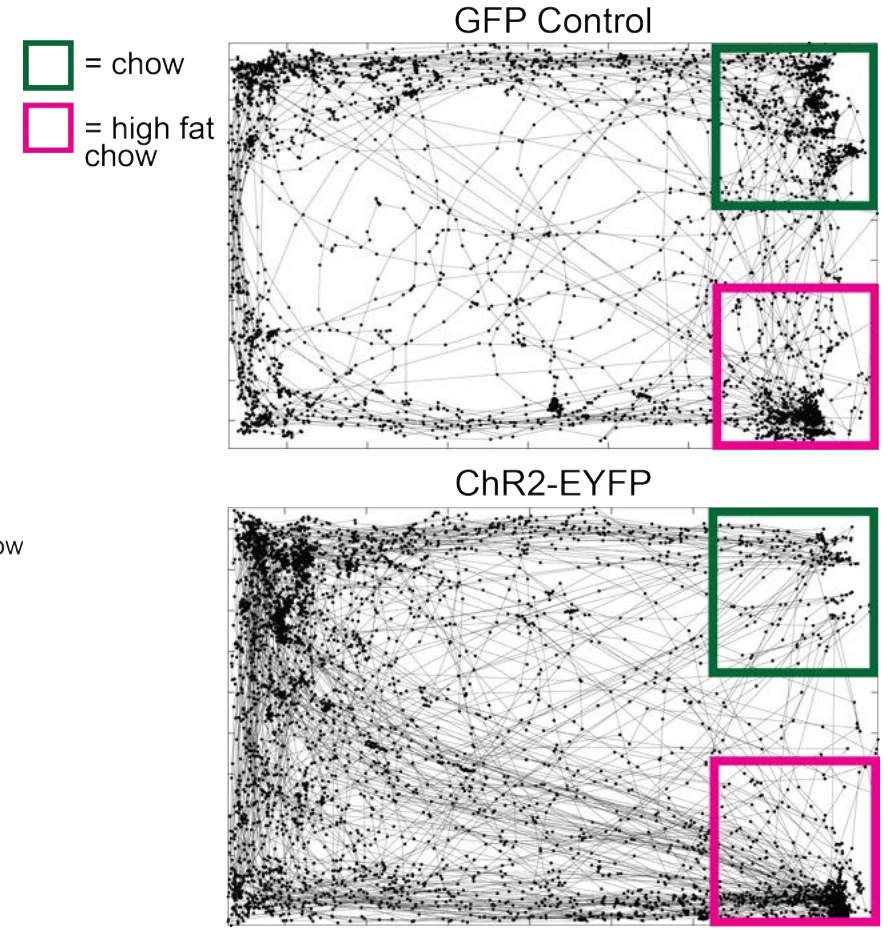




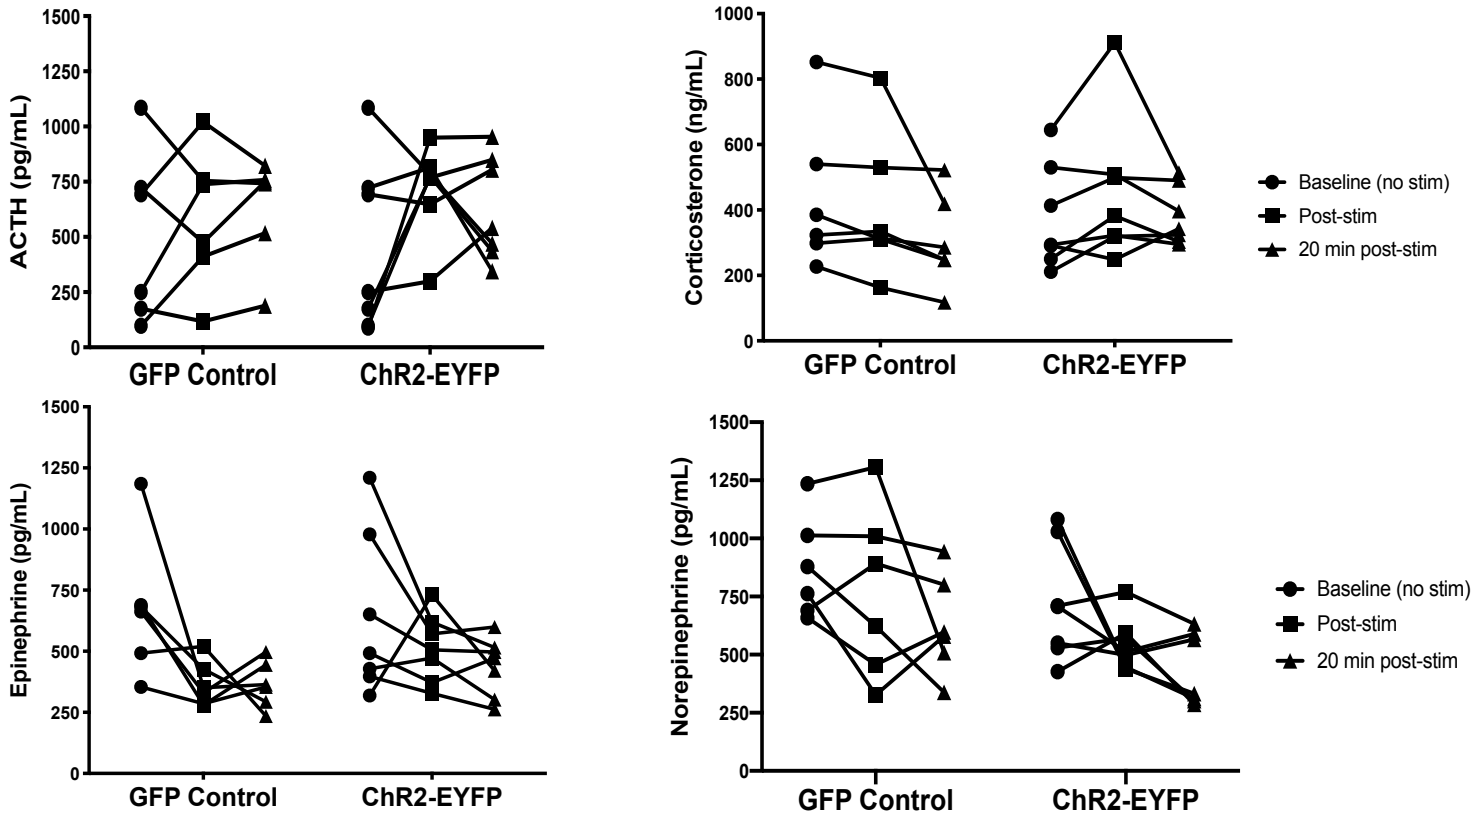


Optogenetic activation of basal forebrain-to-LHb inputs elicits avoidance in the presence of food



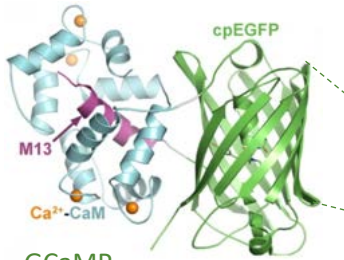


Stress response hormones are not affected with activation of basal forebrain-to-LHb circuit activation



Basal forebrain drive to LHb is "reflexive", and can bypass higher order processing

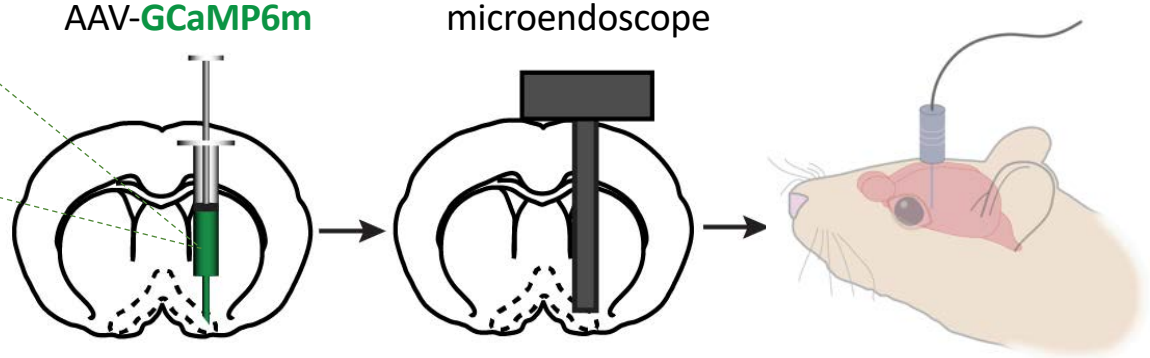
In vivo imaging reveals food responses in basal forebrain



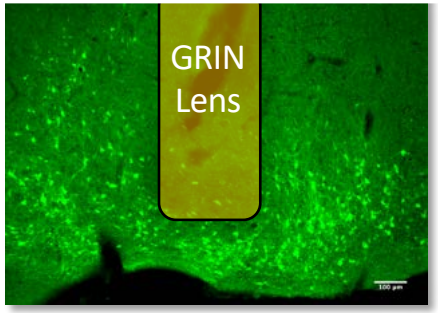
GCaMP
(Ca+2 responsive GFP)

AAV-**GCaMP6m**

microendoscope

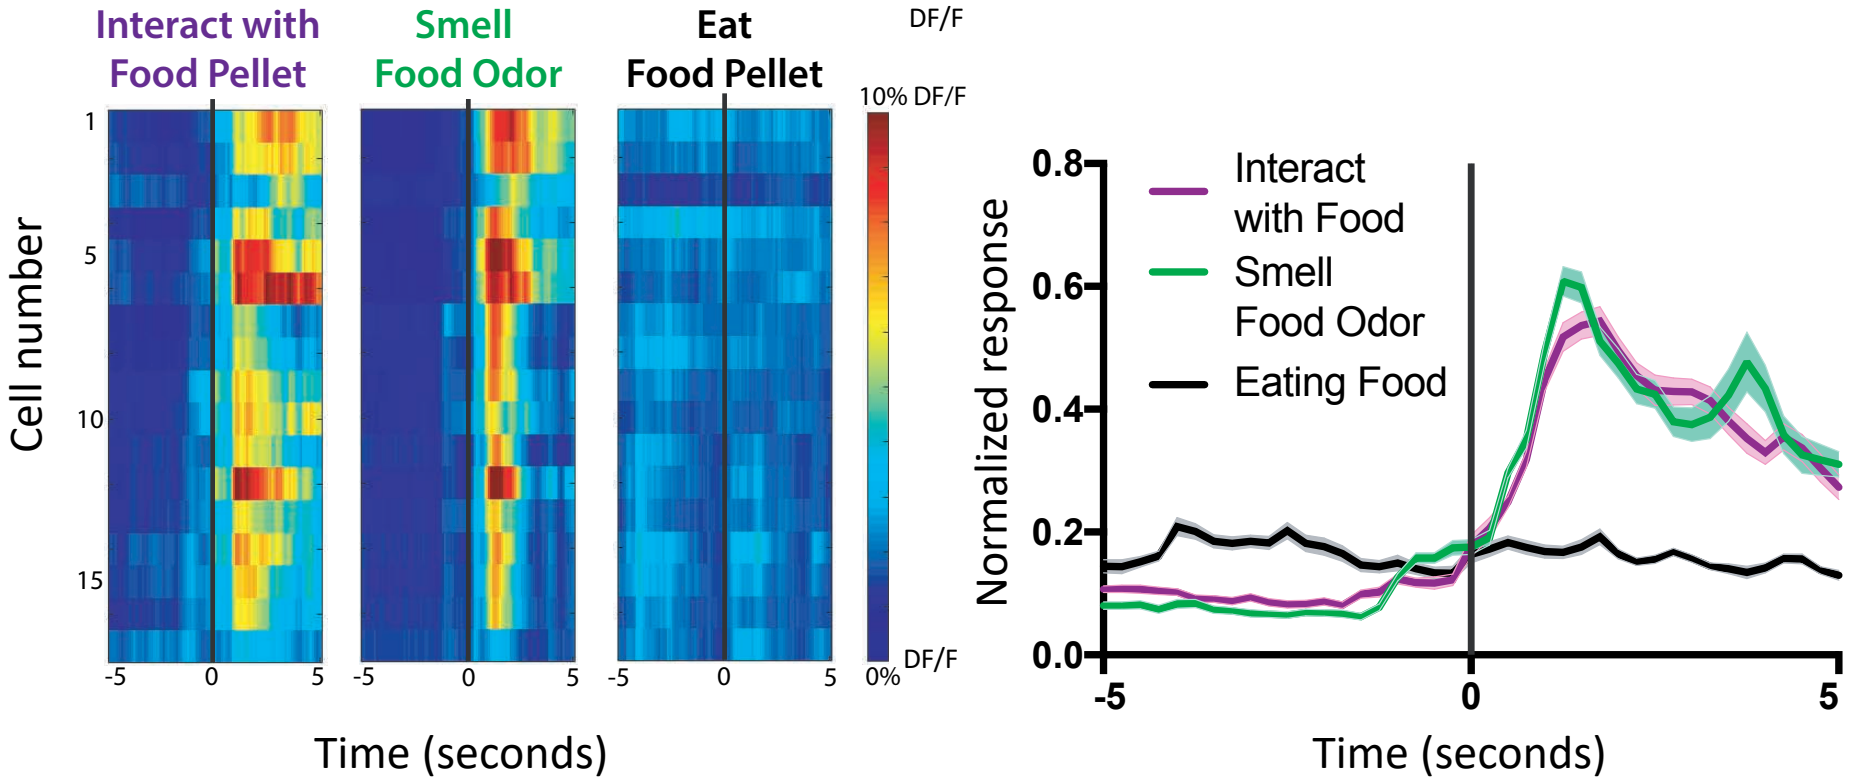


(*Vglut2-Cre or ChAT-Cre; AAV-flex-GCaMP6m*)

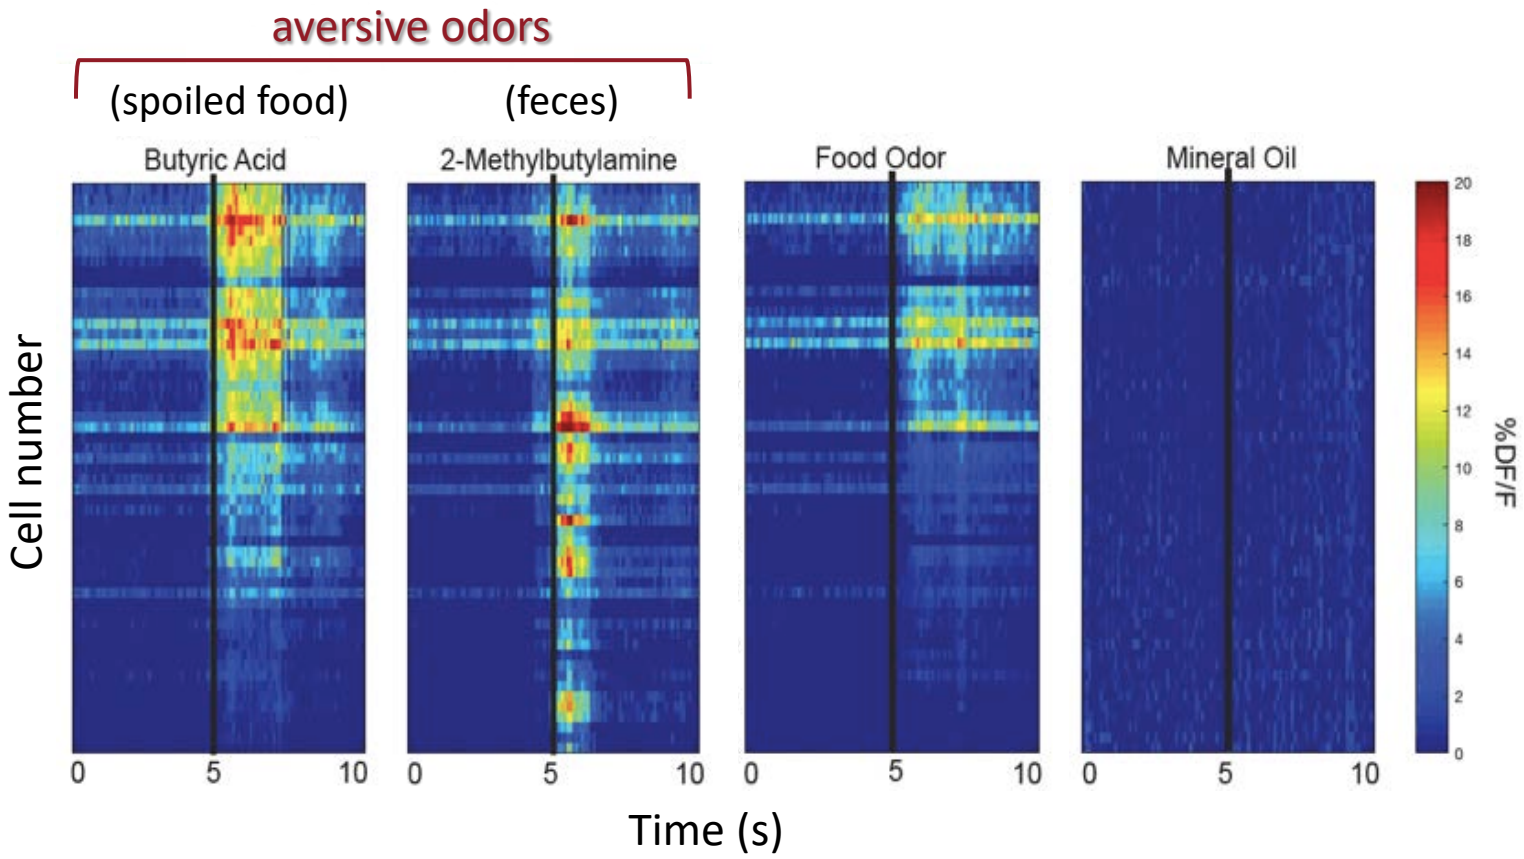


GCaMP6m

Basal forebrain neurons are activated by food-related stimuli



Naturally aversive odors more strongly activate basal forebrain neurons than food



Basal forebrain-to-LHb circuits override homeostatic feeding mechanisms

The cholinergic basal forebrain is a potent integration center that modulates behavioral and physiological output

Sensory cues

Memory, experience, & cognition

AChRs (nicotine)

Cholinergic basal forebrain

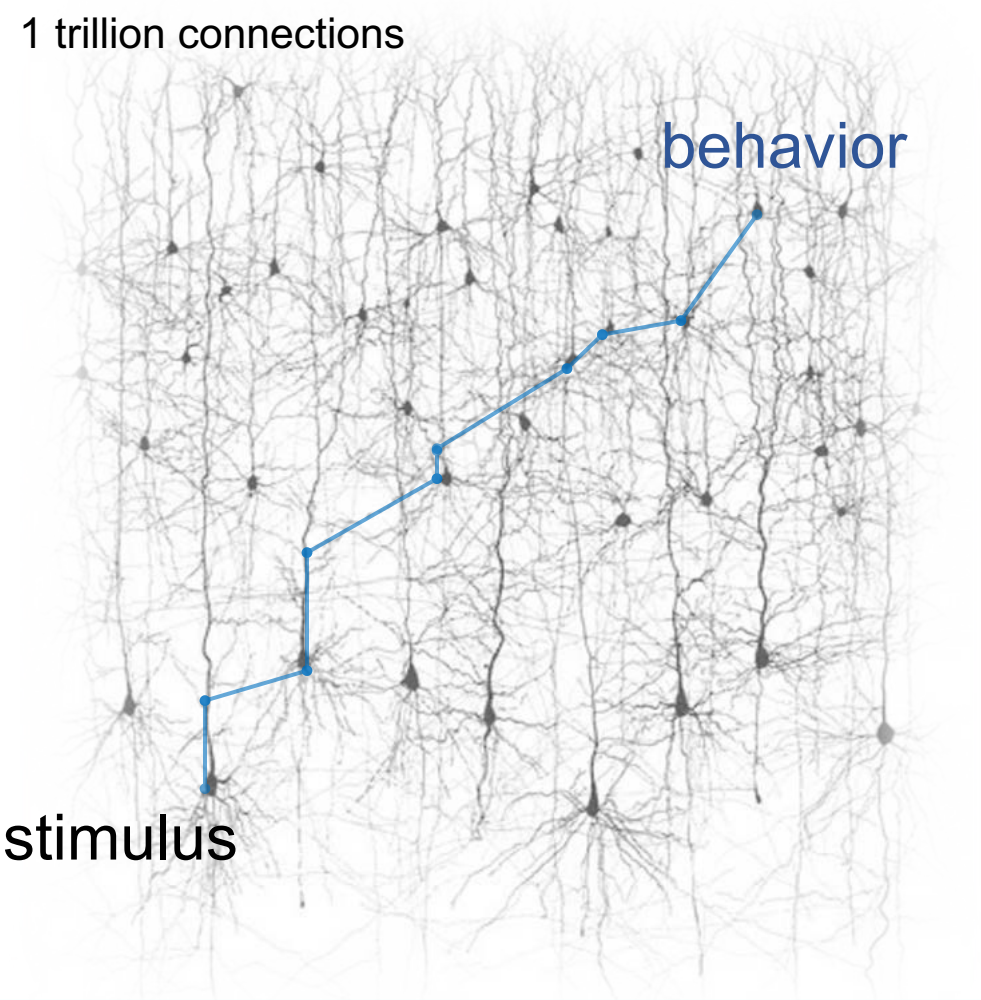
Hypothalamus

Amygdala

Lateral Habenula

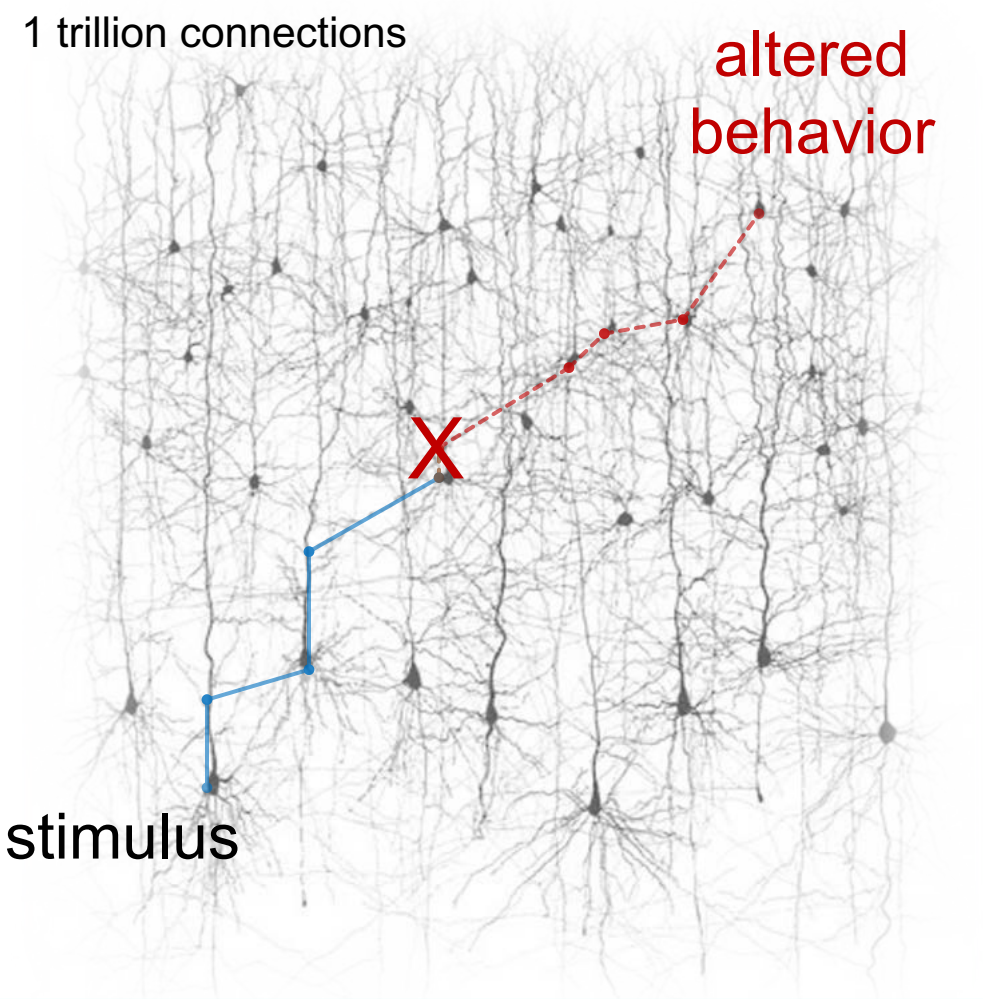
Exploiting circuit complexity may be an approach to treating dysfunction / disease

- 1 billion neurons
- 1 trillion connections



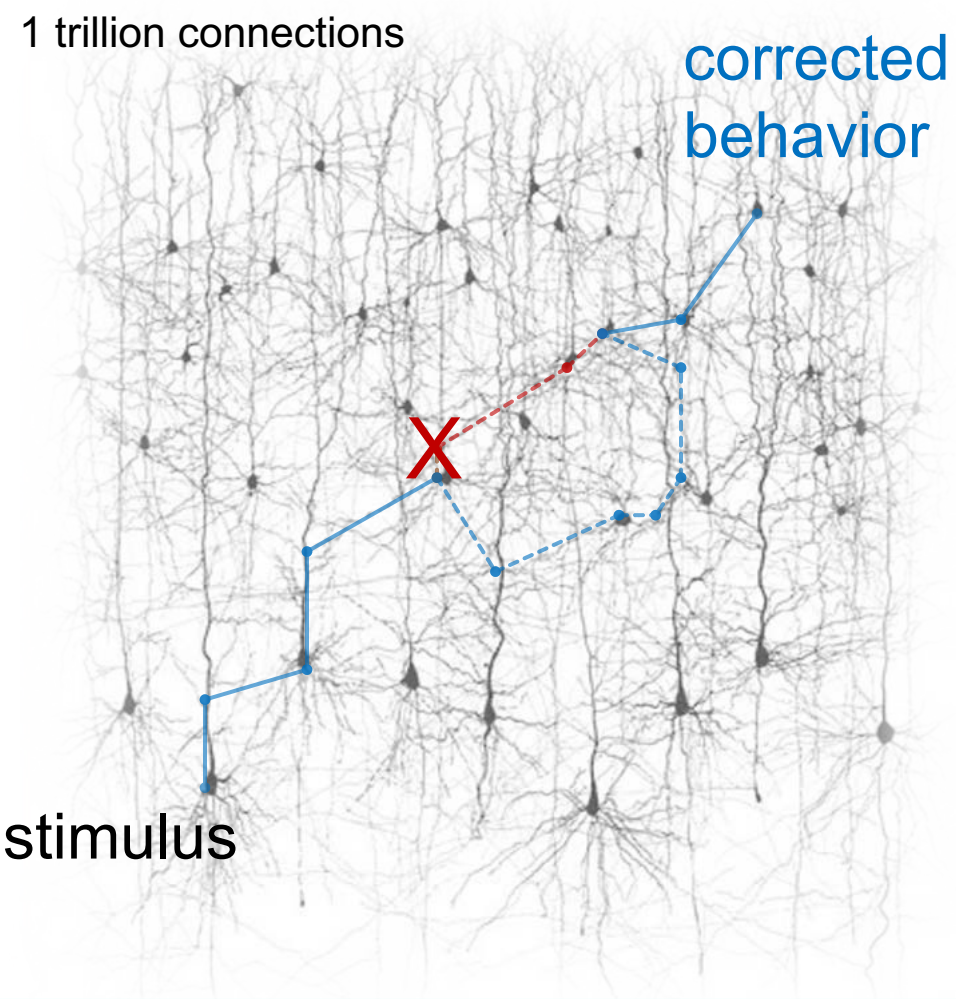
Exploiting circuit complexity may be an approach to treating dysfunction / disease

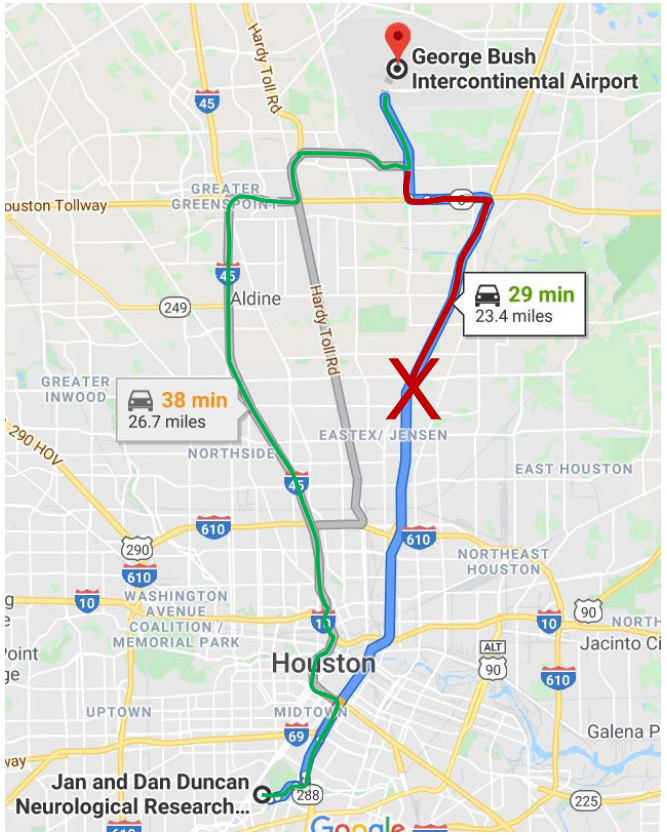
- 1 billion neurons
- 1 trillion connections



Exploiting circuit complexity may be an approach to treating dysfunction / disease

- 1 billion neurons
- 1 trillion connections





In vivo imaging can be used to screen for compounds that gate aversion / reward / feeding circuitry
